if i didn't make that clear today, i should have. we plan to - proximity will be an important factor and i think people are supportive of it

for me, i need to make sure that "fun" gets reinjected... i'm sure the right things will work out

thanks again for the time today, it was helpful

independent of organizational issues, you and chrisjo/joepe should come up with a plan and just do it, you don't need permission.

i think the man may be onto something here...

(wish i had my response tucked away, i recall "launching" on this one)

Basically what everyone is saying is that we have done nothing Microsoft specific that makes IE and IIS work well together. This is a huge missed opportunity. There seems to be a view that we should only do standard things and nothing better than standards even if it helps customers. This is a terrible mistake - it's a mindset that will be fatal if it continues. There is also something wrong with our design process - a lot of ideas were discussed for making IE work better with IIS that would have been very impactful and more important than other things we did do.

HTTP 1.1 which gives better performance is on the outside edge of the desired code complete date, but we will likely get it done. Unfortunately, there won't be a lot else new for IE4/IIS. Chrisjo has been driving some good thinking in this area for IE5, he'll provide some details on that.

I am wondering how far advanced we are in making IE and IIS work better together. In particular

advanced protocol work that would allow the performance to be better because of more compression, less round trips and more caching. I have sent mail on this in the past and there seemed to be strong agreement that there was a lot that could be done with this. I would love to see the IE and IIS groups driving a plan. If we have missed the IE4 Windows to do something cool here that is disappointing.
